Abstract

A computer-formalisation of the essential parts of Fitting's text-book Types, Tableaus and Gödel's God in Isabelle/HOL is presented. In particular, Fitting's (and Anderson's) variant of the ontological argument is verified and confirmed. This variant avoids the modal collapse, which has been criticised as an undesirable side-effect of Kurt Gödel's (and Dana Scott's) versions of the ontological argument. Fitting's work is employing an intensional higher-order modal logic, which we shallowly embed here in classical higher-order logic. We then utilize the embedded logic for the formalisation of Fitting's argument.

1 Introduction

We present a study on Computational Metaphysics: a computer-formalisation and verification of Fitting's variant of the ontological argument (for the existence of God) as presented in his textbook *Types*, *Tableaus and Gödel's God* [12]. Fitting's argument is an emendation of Kurt Gödel's modern variant [15] (resp. Dana Scott's variant [17]) of the ontological argument.

The motivation is to avoid the modal collapse [18, 19], which has been criticised as an undesirable side-effect of the axioms of Gödel resp. Scott. The modal collapse essentially states that there are no contingent truths and that everything is determined. Several authors (e.g. [2, 1, 16, 10]) have proposed emendations of the argument with the aim of maintaining the essential result (the necessary existence of God) while at the same time avoiding the modal collapse. Related work has formalised several of these variants on the computer and verified or falsified them. For example, Gödel's axioms [15] have been shown inconsistent [8, 9] while Scott's version has been verified [5]. Further experiments, contributing amongst others to the clarification of a related debate between Hájek and Anderson, are presented and discussed in [6]. The enabling technique in all of these experiments has been shallow semantical embeddings of (extensional) higher-order modal logics in classical higher-order logic (see [6, 3] and the references therein).

Fitting's emendation also intends to avoid the modal collapse. However, in contrast to the above variants, Fitting's solution is based on the use of an intensional as opposed to an extensional higher-order modal logic. For our work this imposed the additional challenge to provide a shallow embedding of this more advanced logic. The experiments presented below confirm that Fitting's argument as presented in his textbook [12] is valid and that it avoids the modal collapse as intended.

The work presented here originates from the *Computational Metaphysics* lecture course held at FU Berlin in Summer 2016 [7].

2 Embedding of Intensional Higher-Order Modal Logic

The object logic being embedded, intensional higher-order modal logic (IHOML), is a modification of the intentional logic developed by Montague and Gallin [14]. IHOML is introduced by Fitting in the second part of his textbook [12] in order to formalise his emendation of Gödel's ontological argument. We offer here a shallow embedding of this logic in Isabelle/HOL, which has been inspired by previous work on the semantical embedding of multimodal logics with quantification [6]. We expand this approach to allow for actualist quantifiers, intensional types and their related operations.

2.1 Type Declarations

Since IHOML and Isabelle/HOL are both typed languages, we introduce a type-mapping between them. We follow as closely as possible the syntax given by Fitting (see p. 86). According to this syntax, if τ is an extensional type, $\uparrow \tau$ is the corresponding intensional type. For instance, a set of (red) objects has the extensional type $\langle \mathbf{0} \rangle$, whereas the concept 'red' has intensional type $\uparrow \langle \mathbf{0} \rangle$. In what follows, terms having extensional (intensional) types will be called extensional (intensional) terms.

```
typedecl i — type for possible worlds 

type-synonym io = (i \Rightarrow bool) — formulas with world-dependent truth-value 

typedecl e (0) — individuals
```

Aliases for common unary predicate types:

```

2.2.3 Actualist Quantification

The following predicate is used to model actualist quantifiers by restricting the domain of quantification at every possible world. This standard technique has been referred to as *existence relativization* ([13], p. 106), highlighting the fact that this predicate can be seen as a kind of meta-logical 'existence predicate' telling us which individuals *actually* exist at a given world. This meta-logical concept does not appear in our object language.

```
abbreviation mforallAct :: \uparrow \langle \uparrow \langle \mathbf{0} \rangle \rangle (\forall^E)
where \forall^E \Phi \equiv \lambda w. \forall x. (existsAt \ x \ w) \longrightarrow (\Phi \ x \ w)
abbreviation mexistsAct :: \uparrow \langle \uparrow \langle \mathbf{0} \rangle \rangle (\exists^E)
where \exists^E \Phi \equiv \lambda w. \exists \ x. (existsAt \ x \ w) \land (\Phi \ x \ w)
abbreviation mforallActB :: \uparrow \langle \uparrow \langle \mathbf{0} \rangle \rangle (binder \forall^E [8]9) — binder notation where \forall^E x. \ \varphi(x) \equiv \forall^E \varphi

```

2.2.5 Extension-of Operator

According to Fitting's semantics ([12], pp. 92-4) \downarrow is an unary operator applying only to intensional terms. A term of the form $\downarrow \alpha$ designates the extension of the intensional object designated by α , at some given world. For instance, suppose we take possible worlds as people, we can therefore think of the concept 'red' as a function that maps each person to the set of objects that person classifies as red (its extension). We can further state, the intensional term r of type $\uparrow \langle \mathbf{0} \rangle$ designates the concept 'red'. As can be seen, intensional terms in IHOML designate functions on possible worlds and they always do it rigidly. We will sometimes refer to an intensional object explicitly as 'rigid', implying that its (rigidly) designated function has the same extension in all possible worlds.

Terms of the form $\downarrow \alpha$ are called *relativized* (extensional) terms; they are always derived from intensional terms and their type is *extensional* (in the color example $\downarrow r$ would be of type $\langle \mathbf{0} \rangle$). Relativized terms may vary their denotation from world to world of a model, because the extension of an intensional term can change from world to world, i.e. they are non-rigid.

To recap: an intensional term denotes the same function in all worlds (i.e. it's rigid), whereas a relativized term denotes a (possibly) different extension (an object or a set) at every world (i.e. it's non-rigid). To find out the denotation of a relativized term, a world must be given. Relativized terms are the *only* non-rigid terms.

For our Isabelle/HOL embedding, we had to follow a slightly different approach; we model \downarrow as a predicate applying to formulas of the form $\Phi(\downarrow \alpha_1, \ldots \alpha_n)$ (for our treatment we only need to consider cases involving one or two arguments, the first one being a relativized term). For instance, the formula $Q(\downarrow a_1)^w$ (evaluated at world w) is modelled as $\downarrow (Q,a_1)^w$ (or $(Q \downarrow a_1)^w$ using infix notation), which gets further translated into $Q(a_1(w))^w$.

Depending on the particular types involved, we have to define \downarrow differently to ensure type correctness (see a-d below). Nevertheless, the essence of the Extension-of operator remains the same: a term α preceded by \downarrow behaves as a non-rigid term, whose denotation at a given possible world corresponds to the extension of the original intensional term α at that world.

(a) Predicate φ takes as argument a relativized term derived from an (intensional) individual of type $\uparrow \mathbf{0}$:

```
abbreviation extIndivArg::\uparrow\langle \mathbf{0}\rangle \Rightarrow \uparrow \mathbf{0} \Rightarrow io (infix \downarrow 60) where \varphi \downarrow c \equiv \lambda w. \varphi (c w) w
```

- (b) A variant of (a) for terms derived from predicates (types of form $\uparrow \langle t \rangle$): abbreviation $extPredArg::(('t \Rightarrow bool) \Rightarrow io) \Rightarrow ('t \Rightarrow io) \Rightarrow io \text{ (infix } \downarrow 60)$ where $\varphi \downarrow P \equiv \lambda w. \ \varphi \ (\lambda x. \ P \ x \ w) \ w$
- (c) A variant of (b) with a second argument:

```
abbreviation extPredArg1::(('t\Rightarrow bool)\Rightarrow 'b\Rightarrow io)\Rightarrow ('t\Rightarrow io)\Rightarrow 'b\Rightarrow io (infix \downarrow_1 60) where \varphi \downarrow_1 P \equiv \lambda z. \lambda w. \varphi (\lambda x. P x w) z w
```

Following technical definition is needed for type correctness. The '(|-|)' parentheses convert extensional objects into 'rigid' intensional ones:

```
abbreviation trivialExpansion::bool \Rightarrow io ((-)) where (\varphi) \equiv (\lambda w. \varphi)
```

(d) A variant of (b) where φ takes 'rigid' intensional terms as argument: **abbreviation** $mextPredArg::(('t\Rightarrow io)\Rightarrow io)\Rightarrow ('t\Rightarrow io)\Rightarrow io$ (**infix** \downarrow 60) where $\varphi \downarrow P \equiv \lambda w$. $\varphi (\lambda x$. (P x w)) w

2.2.6 Equality

```
abbreviation meq :: {}'t{\Rightarrow}'t{\Rightarrow}io (infix{\approx}6\theta) — normal equality (for all types) where x{\approx}y\equiv\lambda w. x=y abbreviation meqC :: {\uparrow}\langle{\uparrow}\mathbf{0},{\uparrow}\mathbf{0}\rangle (infixr{\approx}^C52) — eq. for individual concepts where x{\approx}^Cy\equiv\lambda w. \forall v. (xv)=(yv) abbreviation meqL :: {\uparrow}\langle{\mathbf{0},\mathbf{0}}\rangle (infixr{\approx}^L52) — Leibniz eq. for individuals where x{\approx}^Ly\equiv\forall\,\varphi. \varphi(x){\rightarrow}\varphi(y)
```

2.2.7 Meta-logical Predicates

```
abbreviation valid :: io \Rightarrow bool \ (\lfloor -\rfloor \ [8]) \ \mathbf{where} \ \lfloor \psi \rfloor \equiv \ \forall \, w. (\psi \ w) abbreviation satisfiable :: io \Rightarrow bool \ (\lfloor -\rfloor^{sat} \ [8]) \ \mathbf{where} \ \lfloor \psi \rfloor^{sat} \equiv \exists \, w. (\psi \ w) abbreviation countersat :: io \Rightarrow bool \ (\lfloor -\rfloor^{csat} \ [8]) \ \mathbf{where} \ \lfloor \psi \rfloor^{csat} \equiv \ \exists \, w. \neg (\psi \ w) abbreviation invalid :: io \Rightarrow bool \ (\lfloor -\rfloor^{inv} \ [8]) \ \mathbf{where} \ \lfloor \psi \rfloor^{inv} \equiv \ \forall \, w. \neg (\psi \ w)
```

2.3 Verifying the Embedding

The above definitions introduce modal logic K with possibilist and actualist quantifiers, as evidenced by the following tests:

Verifying K Principle and Necessitation:

```
lemma K: \lfloor (\Box(\varphi \to \psi)) \to (\Box\varphi \to \Box\psi) \rfloor by simp - K schema lemma NEC: |\varphi| \Longrightarrow |\Box\varphi| by simp - necessitation
```

Local consequence implies global consequence (we will use this lemma often):

```
lemma localImpGlobalCons: [\varphi \to \xi] \Longrightarrow [\varphi] \longrightarrow [\xi] by simp
```

But global consequence does not imply local consequence:

lemma
$$\lfloor \varphi \rfloor \longrightarrow \lfloor \xi \rfloor \Longrightarrow \lfloor \varphi \to \xi \rfloor$$
 nitpick oops — countersatisfiable

Barcan and Converse Barcan Formulas are satisfied for standard (possibilist) quantifiers:

```
lemma [(\forall x. \Box(\varphi x)) \rightarrow \Box(\forall x. (\varphi x))] by simp lemma [\Box(\forall x. (\varphi x)) \rightarrow (\forall x. \Box(\varphi x))] by simp
```

(Converse) Barcan Formulas not satisfied for actualist quantifiers:

```
lemma \lfloor (\forall^E x. \Box(\varphi \ x)) \rightarrow \Box(\forall^E x. (\varphi \ x)) \rfloor nitpick oops — countersatisfiable lemma \lfloor \Box(\forall^E x. (\varphi \ x)) \rightarrow (\forall^E x. \Box(\varphi \ x)) \rfloor nitpick oops — countersatisfiable
```

Above we have made use of (counter-)model finder *Nitpick* [11] for the first time. For all the conjectured lemmas above, *Nitpick* has found a countermodel, i.e. a model satisfying all the axioms which falsifies the given formula. This means, the formulas are not valid.

Well known relations between meta-logical notions:

```
\begin{array}{ll} \mathbf{lemma} & \lfloor \varphi \rfloor \longleftrightarrow \neg \lfloor \varphi \rfloor^{csat} \ \mathbf{by} \ simp \\ \mathbf{lemma} & \lfloor \varphi \rfloor^{sat} \longleftrightarrow \neg \lfloor \varphi \rfloor^{inv} \ \mathbf{by} \ simp \end{array}
```

Contingent truth does not allow for necessitation:

```
\begin{array}{lll} \mathbf{lemma} \ \lfloor \Diamond \varphi \rfloor & \longrightarrow \lfloor \Box \varphi \rfloor \ \mathbf{nitpick} \ \mathbf{oops} & \longrightarrow \mathbf{countersatisfiable} \\ \mathbf{lemma} \ \vert \Box \varphi \vert^{sat} & \longrightarrow \vert \Box \varphi \vert \ \mathbf{nitpick} \ \mathbf{oops} & \longrightarrow \mathbf{countersatisfiable} \\ \end{array}
```

 $Modal\ collapse$ is countersatisfiable:

lemma
$$|\varphi \to \Box \varphi|$$
 nitpick oops — countersatisfiable

2.4 Useful Definitions for Axiomatization of Further Logics

The best known normal logics (K4, K5, KB, K45, KB5, D, D4, D5, D45, ...) can be obtained by combinations of the following axioms:

```
abbreviation M where M \equiv \forall \, \varphi. \, \Box \varphi \rightarrow \varphi abbreviation B where B \equiv \forall \, \varphi. \, \varphi \rightarrow \, \Box \Diamond \varphi abbreviation D where D \equiv \forall \, \varphi. \, \Box \varphi \rightarrow \Diamond \varphi abbreviation IV where IV \equiv \forall \, \varphi. \, \Box \varphi \rightarrow \, \Box \Box \varphi abbreviation V where V \equiv \forall \, \varphi. \, \Diamond \varphi \rightarrow \, \Box \Diamond \varphi
```

Instead of postulating (combinations of) the above axioms we instead make use of the well-known $Sahlqvist\ correspondence$, which links axioms to constraints on a model's accessibility relation (e.g. reflexive, symmetric, etc.; the definitions of which are not shown here). We show that reflexivity, symmetry, seriality, transitivity and euclideanness imply axioms M, B, D, IV, V respectively.

```
lemma reflexive aRel \implies \lfloor M \rfloor by blast— aka T lemma symmetric aRel \implies \lfloor B \rfloor by blast lemma serial aRel \implies \lfloor D \rfloor by blast lemma transitive aRel \implies \lfloor IV \rfloor by blast lemma euclidean aRel \implies \lfloor V \rfloor by blast lemma preorder aRel \implies \lfloor M \rfloor \land \lfloor IV \rfloor by blast— S4: reflexive + transitive lemma equivalence aRel \implies \lfloor M \rfloor \land \lfloor V \rfloor by blast— S5: preorder + symmetric
```

lemma reflexive aRel \land euclidean aRel \implies $|M| \land |V|$ by blast — S5

Using these definitions, we can derive axioms for the most common modal logics (see also [4]). Thereby we are free to use either the semantic constraints or the related *Sahlqvist* axioms. Here we provide both versions. In what follows we use the semantic constraints (for improved performance).

3 Textbook Examples

In this section we provide further evidence that our embedded logic works as intended by proving the examples discussed in the book. In many cases, we consider further theorems which we derived from the original ones. We were able to confirm that all results (proofs or counterexamples) agree with Fitting's claims.

3.1 Modal Logic - Syntax and Semantics (Chapter 7)

Reminder: We call a term relativized if it is of the form $\downarrow \alpha$ (i.e. an intensional term preceded by the extension-of operator), otherwise it is non-relativized. Relativized terms are non-rigid and non-relativized terms are rigid.

3.1.1 Considerations Regarding $\beta\eta$ -redex (p. 94)

 $\beta\eta$ -redex is valid for non-relativized (intensional or extensional) terms (because they designate rigidly):

```
lemma [((\lambda \alpha. \varphi \alpha) \ (\tau :: \uparrow \mathbf{0})) \leftrightarrow (\varphi \ \tau)] by simp lemma [((\lambda \alpha. \varphi \alpha) \ (\tau :: \bullet \mathbf{0})) \leftrightarrow (\varphi \ \tau)] by simp lemma [((\lambda \alpha. \Box \varphi \alpha) \ (\tau :: \uparrow \mathbf{0})) \leftrightarrow (\Box \varphi \ \tau)] by simp lemma [((\lambda \alpha. \Box \varphi \alpha) \ (\tau :: \bullet \mathbf{0})) \leftrightarrow (\Box \varphi \ \tau)] by simp
```

 $\beta\eta$ -redex is valid for relativized terms as long as no modal operators occur inside the predicate abstract:

```
lemma |((\lambda \alpha. \varphi \alpha) \downarrow (\tau :: \uparrow \mathbf{0})) \leftrightarrow (\varphi \downarrow \tau)| by simp
```

 $\beta\eta$ -redex is non-valid for relativized terms when modal operators are present:

```
lemma \lfloor ((\lambda \alpha. \Box \varphi \ \alpha) \ \rfloor (\tau :: \uparrow \mathbf{0})) \leftrightarrow (\Box \varphi \ \rfloor \tau) \rfloor nitpick oops — countersatisfiable lemma \lfloor ((\lambda \alpha. \Diamond \varphi \ \alpha) \ \rfloor (\tau :: \uparrow \mathbf{0})) \leftrightarrow (\Diamond \varphi \ \rfloor \tau) \rfloor nitpick oops — countersatisfiable
```

Example 7.13, p. 96:

```
\begin{array}{l} \mathbf{lemma} \ \lfloor (\lambda X. \lozenge \exists \, X) \ \ (P :: \uparrow \langle \mathbf{0} \rangle) \to \lozenge((\lambda X. \ \exists \, X) \ \ P) \rfloor \ \ \mathbf{by} \ simp \\ \mathbf{lemma} \ \lfloor (\lambda X. \lozenge \exists \, X) \ \downarrow (P :: \uparrow \langle \mathbf{0} \rangle) \to \lozenge((\lambda X. \ \exists \, X) \ \downarrow P) \rfloor \\ \mathbf{nitpick} [\mathit{card} \ 't = 1, \ \mathit{card} \ i = 2] \ \mathbf{oops} \ -- \ \mathrm{nitpick} \ \mathrm{finds} \ \mathrm{same} \ \mathrm{counterexample} \ \mathrm{as} \ \mathrm{book} \end{array}
```

with other types for P:

```
nitpick[card 't=1, card i=2] oops — countersatisfiable
Example 7.14, p. 98:
lemma |(\lambda X. \lozenge \exists X) \downarrow (P::\uparrow \langle \mathbf{0} \rangle) \rightarrow (\lambda X. \exists X) \downarrow P | by simp
lemma |(\lambda X. \Diamond \exists X) (P::\uparrow\langle \mathbf{0}\rangle) \rightarrow (\lambda X. \exists X) P|
  nitpick[card 't=1, card i=2] oops — countersatisfiable
with other types for P:
lemma \lfloor (\lambda X. \lozenge \exists X) \downarrow (P :: \uparrow \langle \uparrow \mathbf{0} \rangle) \rightarrow (\lambda X. \exists X) \downarrow P \rfloor by simp
lemma |(\lambda X. \lozenge \exists X) \ (P::\uparrow \langle \uparrow \mathbf{0} \rangle) \to (\lambda X. \exists X) \ P|
  nitpick[card 't=1, card i=2] oops — countersatisfiable
lemma |(\lambda X. \Diamond \exists X) \downarrow (P::\uparrow\langle\langle \mathbf{0}\rangle\rangle) \rightarrow (\lambda X. \exists X) \downarrow P| by simp
lemma |(\lambda X. \lozenge \exists X) \ (P::\uparrow\langle\langle \mathbf{0}\rangle\rangle) \to (\lambda X. \exists X) \ P|
  nitpick[card 't=1, card i=2] oops — countersatisfiable
lemma |(\lambda X. \lozenge \exists X) \downarrow (P::\uparrow\langle\uparrow\langle\mathbf{0}\rangle\rangle) \rightarrow (\lambda X. \exists X) \downarrow P| by simp
lemma |(\lambda X. \Diamond \exists X) (P::\uparrow\langle \uparrow \langle \mathbf{0} \rangle) \rightarrow (\lambda X. \exists X) P|
  nitpick[card 't=1, card i=2] oops — countersatisfiable
Example 7.15, p. 99:
lemma |\Box(P(c::\uparrow \mathbf{0})) \rightarrow (\exists x::\uparrow \mathbf{0}. \Box(Px))| by auto
with other types for P:
lemma |\Box(P(c::0)) \rightarrow (\exists x::0. \Box(Px))| by auto
lemma |\Box(P(c::\langle \mathbf{0}\rangle)) \rightarrow (\exists x::\langle \mathbf{0}\rangle. \Box(Px))| by auto
Example 7.16, p. 100:
lemma [\Box(P \downarrow (c::\uparrow \mathbf{0})) \rightarrow (\exists x::\mathbf{0}. \Box(P x))]
  nitpick[card 't=2, card i=2] oops — counterexample with two worlds found
Example 7.17, p. 101:
lemma |\forall Z :: \uparrow \mathbf{0}. (\lambda x :: \mathbf{0}. \Box ((\lambda y :: \mathbf{0}. x \approx y) \downarrow Z)) \downarrow Z|
  nitpick[card 't=2, card i=2] oops — countersatisfiable
lemma |\forall z::\mathbf{0}. (\lambda x::\mathbf{0}. \Box((\lambda y::\mathbf{0}. x \approx y) z)) z| by simp
lemma |\forall Z::\uparrow 0. (\lambda X::\uparrow 0. \Box((\lambda Y::\uparrow 0. X \approx Y) Z)) Z| by simp
```

3.1.2 Exercises (p. 101)

For Exercises 7.1 and 7.2 see variations on Examples 7.13 and 7.14 above.

Exercise 7.3:

```
lemma |\lozenge \exists (P::\uparrow \langle \mathbf{0} \rangle) \rightarrow (\exists X::\uparrow \mathbf{0}. \lozenge (P \mid X))| by auto
```

Exercise 7.4:

lemma
$$[\lozenge(\exists x::\mathbf{0}.\ (\lambda Y.\ Yx) \downarrow (P::\uparrow\langle\mathbf{0}\rangle)) \rightarrow (\exists x.\ (\lambda Y.\ \lozenge(Yx)) \downarrow P)]$$
 nitpick[card 't=1, card i=2] oops — countersatisfiable

For Exercise 7.5 see Example 7.17 above.

3.2 Miscellaneous Matters (Chapter 9)

3.2.1 Equality Axioms (Subsection 1.1)

Example 9.1:

```
lemma \lfloor ((\lambda X. \Box(X \downarrow (p::\uparrow \mathbf{0}))) \downarrow (\lambda x. \Diamond(\lambda z. z \approx x) \downarrow p)) \rfloor by auto — using normal equality lemma \lfloor ((\lambda X. \Box(X \downarrow (p::\uparrow \mathbf{0}))) \downarrow (\lambda x. \Diamond(\lambda z. z \approx^L x) \downarrow p)) \rfloor by auto — using Leibniz equality lemma \lfloor ((\lambda X. \Box(X \mid (p::\uparrow \mathbf{0}))) \downarrow (\lambda x. \Diamond(\lambda z. z \approx^C x) p)) \rfloor by simp — using equality as defined for individual concepts
```

3.2.2 Extensionality (Subsection 1.2)

In Fitting's book (p. 118), extensionality is assumed (globally) for extensional terms. While Fitting introduces the following extensionality principles as axioms, they are already implicitly valid in Isabelle/HOL:

```
lemma EXT: \forall \alpha ::: \langle \mathbf{0} \rangle. \ \forall \beta ::: \langle \mathbf{0} \rangle. \ (\forall \gamma ::: \mathbf{0}. \ (\alpha \ \gamma \longleftrightarrow \beta \ \gamma)) \longrightarrow (\alpha = \beta) by auto lemma EXT-set: \forall \alpha ::: \langle \langle \mathbf{0} \rangle \rangle. \ \forall \beta ::: \langle \langle \mathbf{0} \rangle \rangle. \ (\forall \gamma ::: \langle \mathbf{0} \rangle. \ (\alpha \ \gamma \longleftrightarrow \beta \ \gamma)) \longrightarrow (\alpha = \beta) by auto
```

3.2.3 De Re and De Dicto (Subsection 2)

De re is equivalent to de dicto for non-relativized (extensional or intensional) terms:

```
lemma [\forall \alpha. ((\lambda \beta. \Box(\alpha \beta)) \ (\tau :: \mathbf{0})) \leftrightarrow \Box((\lambda \beta. (\alpha \beta)) \ \tau)] by simp lemma [\forall \alpha. ((\lambda \beta. \Box(\alpha \beta)) \ (\tau :: \uparrow \mathbf{0})) \leftrightarrow \Box((\lambda \beta. (\alpha \beta)) \ \tau)] by simp lemma [\forall \alpha. ((\lambda \beta. \Box(\alpha \beta)) \ (\tau :: \uparrow \langle \mathbf{0} \rangle)) \leftrightarrow \Box((\lambda \beta. (\alpha \beta)) \ \tau)] by simp lemma [\forall \alpha. ((\lambda \beta. \Box(\alpha \beta)) \ (\tau :: \uparrow \langle \mathbf{0} \rangle)) \leftrightarrow \Box((\lambda \beta. (\alpha \beta)) \ \tau)] by simp
```

De re is not equivalent to de dicto for relativized terms:

```
lemma [\forall \alpha. ((\lambda \beta. \Box(\alpha \beta)) \downarrow (\tau :: \uparrow \mathbf{0})) \leftrightarrow \Box((\lambda \beta. (\alpha \beta)) \downarrow \tau)]

nitpick[card 't=2, card i=2] oops — countersatisfiable

lemma [\forall \alpha. ((\lambda \beta. \Box(\alpha \beta)) \downarrow (\tau :: \uparrow \langle \mathbf{0} \rangle)) \leftrightarrow \Box((\lambda \beta. (\alpha \beta)) \downarrow \tau)]

nitpick[card 't=1, card i=2] oops — countersatisfiable
```

Proposition 9.6 - If we can prove one side of the equivalence, then we can prove the other (p. 120):

```
abbreviation deDictoImplDeRe::\uparrow \mathbf{0} \Rightarrow io

where deDictoImplDeRe \ \tau \equiv \forall \ \alpha. \ \Box((\lambda\beta. \ (\alpha \ \beta)) \ \downarrow \tau) \rightarrow ((\lambda\beta. \ \Box(\alpha \ \beta)) \ \downarrow \tau)

abbreviation deReImplDeDicto::\uparrow \mathbf{0} \Rightarrow io

where deReImplDeDicto \ \tau \equiv \forall \ \alpha. \ ((\lambda\beta. \ \Box(\alpha \ \beta)) \ \downarrow \tau) \rightarrow \Box((\lambda\beta. \ (\alpha \ \beta)) \ \downarrow \tau)

abbreviation deReEquDeDicto::\uparrow \mathbf{0} \Rightarrow io

where deReEquDeDicto \ \tau \equiv \forall \ \alpha. \ ((\lambda\beta. \ \Box(\alpha \ \beta)) \ \downarrow \tau) \rightarrow \Box((\lambda\beta. \ (\alpha \ \beta)) \ \downarrow \tau)

abbreviation deDictoImplDeRe-pred::('t \Rightarrow io) \Rightarrow io

where deDictoImplDeRe-pred \ \tau \equiv \forall \ \alpha. \ \Box((\lambda\beta. \ (\alpha \ \beta)) \ \downarrow \tau) \rightarrow ((\lambda\beta. \ \Box(\alpha \ \beta)) \ \downarrow \tau)
```

```
abbreviation deReImplDeDicto-pred::('t\Rightarrow io)\Rightarrow io
where deReImplDeDicto-pred \ \tau \equiv \forall \ \alpha. \ ((\lambda\beta. \ \Box(\alpha \ \beta)) \ \downarrow \tau) \ \rightarrow \ \Box((\lambda\beta. \ (\alpha \ \beta)) \ \downarrow \tau)
abbreviation deReEquDeDicto-pred::('t\Rightarrow io)\Rightarrow io
where deReEquDeDicto-pred \ \tau \equiv \forall \ \alpha. \ ((\lambda\beta. \ \Box(\alpha \ \beta)) \ \downarrow \tau) \ \leftrightarrow \ \Box((\lambda\beta. \ (\alpha \ \beta)) \ \downarrow \tau)
```

We can prove local consequence:

```
lemma AimpB: \lfloor deReImplDeDicto \ (\tau::\uparrow \mathbf{0}) \rightarrow deDictoImplDeRe \ \tau \rfloor by force — for individuals lemma AimpB-p: \lfloor deReImplDeDicto-pred \ (\tau::\uparrow \langle \mathbf{0} \rangle) \rightarrow deDictoImplDeRe-pred \ \tau \rfloor by force — for predicates
```

And global consequence follows directly (since local consequence implies global consequence, as shown before):

```
lemma \lfloor deReImplDeDicto \ (\tau::\uparrow \mathbf{0}) \rfloor \longrightarrow \lfloor deDictoImplDeRe \ \tau \rfloor using AimpB by (rule\ localImpGlobalCons) — for individuals lemma \lfloor deReImplDeDicto-pred\ (\tau::\uparrow \langle \mathbf{0} \rangle) \rfloor \longrightarrow \lfloor deDictoImplDeRe-pred\ \tau \rfloor using AimpB-p by (rule\ localImpGlobalCons) — for predicates
```

3.2.4 Rigidity (Subsection 3)

(Local) rigidity for intensional individuals:

```
abbreviation rigidIndiv::\uparrow\langle\uparrow\mathbf{0}\rangle where rigidIndiv\ \tau \equiv (\lambda\beta.\ \Box((\lambda z.\ \beta\thickapprox z)\ |\tau))\ |\tau
```

(Local) rigidity for intensional predicates:

```
abbreviation rigidPred::('t\Rightarrow io)\Rightarrow io where rigidPred \ \tau \equiv (\lambda\beta. \ \Box((\lambda z. \ \beta \approx z) \ \downarrow \tau)) \ \downarrow \tau
```

Proposition 9.8 - An intensional term is rigid if and only if the $de\ re/de\ dicto$ distinction vanishes. Note that we can prove this theorem for local consequence (global consequence follows directly).

```
lemma \lfloor rigidIndiv\ (\tau::\uparrow \mathbf{0}) \to deReEquDeDicto\ \tau \rfloor by simp lemma \lfloor deReImplDeDicto\ (\tau::\uparrow \mathbf{0}) \to rigidIndiv\ \tau \rfloor by auto lemma \lfloor rigidPred\ (\tau::\uparrow \langle \mathbf{0} \rangle) \to deReEquDeDicto-pred\ \tau \rfloor by simp lemma \lfloor deReImplDeDicto-pred\ (\tau::\uparrow \langle \mathbf{0} \rangle) \to rigidPred\ \tau \rfloor by auto
```

3.2.5 Stability Conditions (Subsection 4)

axiomatization where

S5: equivalence aRel — using Sahlqvist correspondence for improved performance

Definition 9.10 - Stability conditions come in pairs:

```
abbreviation stabilityA::('t\Rightarrow io)\Rightarrow io where stabilityA \ \tau \equiv \forall \ \alpha. \ (\tau \ \alpha) \rightarrow \Box(\tau \ \alpha) abbreviation stabilityB::('t\Rightarrow io)\Rightarrow io where stabilityB \ \tau \equiv \forall \ \alpha. \ \Diamond(\tau \ \alpha) \rightarrow (\tau \ \alpha)
```

Proposition 9.10 - In an S5 modal logic both stability conditions are equivalent.

The last proposition holds for global consequence:

```
lemma \lfloor stabilityA \ (\tau::\uparrow\langle \mathbf{0}\rangle) \rfloor \longrightarrow \lfloor stabilityB \ \tau \rfloor using S5 by blast lemma \lfloor stabilityB \ (\tau::\uparrow\langle \mathbf{0}\rangle) \rfloor \longrightarrow \lfloor stabilityA \ \tau \rfloor using S5 by blast
```

But it does not hold for local consequence:

```
lemma \lfloor stabilityA \ (\tau :: \uparrow \langle \mathbf{0} \rangle) \rightarrow stabilityB \ \tau \rfloor

nitpick\lfloor card \ 't=1, \ card \ i=2 \rfloor oops — countersatisfiable

lemma \lfloor stabilityB \ (\tau :: \uparrow \langle \mathbf{0} \rangle) \rightarrow stabilityA \ \tau \rfloor

nitpick\lfloor card \ 't=1, \ card \ i=2 \rfloor oops — countersatisfiable
```

Theorem 9.11 - A term is rigid if and only if it satisfies the stability conditions. Note that we can prove this theorem for local consequence (global consequence follows directly).

```
theorem \lfloor rigidPred\ (\tau::\uparrow\langle\mathbf{0}\rangle) \leftrightarrow (stabilityA\ \tau \land stabilityB\ \tau) \rfloor by meson theorem \lfloor rigidPred\ (\tau::\uparrow\langle\uparrow\mathbf{0}\rangle) \leftrightarrow (stabilityA\ \tau \land stabilityB\ \tau) \rfloor by meson theorem \lfloor rigidPred\ (\tau::\uparrow\langle\uparrow\langle\mathbf{0}\rangle\rangle) \leftrightarrow (stabilityA\ \tau \land stabilityB\ \tau) \rfloor by meson
```

4 Gödel's Argument, Formally

"Gödel's particular version of the argument is a direct descendent of that of Leibniz, which in turn derives from one of Descartes. These arguments all have a two-part structure: prove God's existence is necessary, if possible; and prove God's existence is possible." [12], p. 138.

4.1 Part I - God's Existence is Possible

We separate Gödel's Argument as presented in Fitting's textbook (ch. 11) in two parts. For the first one, while Leibniz provides some kind of proof for the compatibility of all perfections, Gödel goes on to prove an analogous result: (T1) Every positive property is possibly instantiated, which together with (T2) God is a positive property directly implies the conclusion. In order to prove T1, Gödel assumes A2: Any property entailed by a positive property is positive.

We are currently contemplating a follow-up analysis of the philosophical implications of these axioms, which encompasses some criticism of the notion of *property entailment* used by Gödel throughout the argument.

4.1.1 General Definitions

```
abbreviation existencePredicate::\uparrow\langle \mathbf{0}\rangle (E!) where E! \ x \equiv \lambda w. (\exists^E y. \ y \approx x) w — existence predicate in object language lemma E! \ x \ w \longleftrightarrow existsAt \ x \ w by simp — safety check: E! correctly matches its meta-logical counterpart consts positiveProperty::\uparrow\langle\uparrow\langle\mathbf{0}\rangle\rangle (\mathcal{P}) — positiveness/perfection

Definitions of God (later shown to be equivalent under axiom A1b): abbreviation God::\uparrow\langle\mathbf{0}\rangle (G) where G \equiv (\lambda x. \ \forall \ Y. \ \mathcal{P}\ \ Y \to \ Y\ x) abbreviation God-star::\uparrow\langle\mathbf{0}\rangle (G*) where G*\equiv (\lambda x. \ \forall \ Y. \ \mathcal{P}\ \ Y \leftrightarrow \ Y\ x)

Definitions needed to formalise A3: abbreviation appliesToPositiveProps::\uparrow\langle\uparrow\langle\uparrow\langle\mathbf{0}\rangle\rangle\rangle (pos) where pos\ Z \equiv \ \forall\ X. \ Z\ X \to \mathcal{P}\ X abbreviation intersectionOf::\uparrow\langle\uparrow\langle\mathbf{0}\rangle,\uparrow\langle\uparrow\langle\mathbf{0}\rangle\rangle\rangle (intersec) where intersec\ X\ Z \equiv \ \Box(\forall\ x.(X\ x \leftrightarrow (\forall\ Y.(Z\ Y) \to (Y\ x))))) — quantifier is possibilist abbreviation Entailment::\uparrow\langle\uparrow\langle\mathbf{0}\rangle,\uparrow\langle\mathbf{0}\rangle\rangle (infix \Rightarrow 60) where X \Rightarrow Y \equiv \ \Box(\forall\ Ez.\ X\ z \to Y\ z)
```

4.1.2 Axioms

axiomatization where

$$\begin{array}{lll} A1a: \left[\forall \, X. \, \mathcal{P} \, \left(\rightarrow X \right) \rightarrow \neg (\mathcal{P} \, X) \, \right] \, \mathbf{and} & -\text{ axiom } 11.3 \mathrm{A} \\ A1b: \left[\forall \, X. \, \neg (\mathcal{P} \, X) \rightarrow \mathcal{P} \, \left(\rightarrow X \right) \right] \, \mathbf{and} & -\text{ axiom } 11.3 \mathrm{B} \\ A2: \left[\forall \, X \, Y. \, \left(\mathcal{P} \, X \wedge \left(X \, \Rrightarrow \, Y \right) \right) \rightarrow \mathcal{P} \, Y \right] \, \mathbf{and} & -\text{ axiom } 11.5 \\ A3: \left[\forall \, Z \, X. \, \left(pos \, Z \wedge intersec \, X \, Z \right) \rightarrow \mathcal{P} \, X \right] - \text{ axiom } 11.10 \end{array}$$

lemma True nitpick[satisfy] oops — model found: axioms are consistent

lemma $\lfloor D \rfloor$ **using** A1a A1b A2 by blast — axioms already imply D axiom **lemma** $\lfloor D \rfloor$ **using** A1a A3 by metis

4.1.3 Theorems

lemma
$$[\exists X. \mathcal{P} X]$$
 using A1b by auto lemma $[\exists X. \mathcal{P} X \land \Diamond \exists^E X]$ using A1a A1b A2 by metis

Being self-identical is a positive property:

lemma
$$|(\exists X. \mathcal{P} X \land \Diamond \exists^E X) \rightarrow \mathcal{P} (\lambda x w. x = x)|$$
 using A2 by fastforce

Proposition 11.6

lemma
$$[(\exists X. \mathcal{P} X) \rightarrow \mathcal{P} (\lambda x w. x = x)]$$
 using A2 by fastforce

lemma
$$\lfloor \mathcal{P} \ (\lambda x \ w. \ x = x) \rfloor$$
 using A1b A2 by blast lemma $\lfloor \mathcal{P} \ (\lambda x \ w. \ x = x) \rfloor$ using A3 by metis

Being non-self-identical is a negative property:

lemma
$$\lfloor (\exists X. \mathcal{P} X \land \Diamond \exists^E X) \rightarrow \mathcal{P} (\rightarrow (\lambda x \ w. \ \neg x = x)) \rfloor$$
 using $A2$ by fastforce

lemma
$$[(\exists X. \mathcal{P} X) \rightarrow \mathcal{P} (\rightarrow (\lambda x \ w. \ \neg x = x))]$$
 using $A2$ by fastforce lemma $[(\exists X. \mathcal{P} X) \rightarrow \mathcal{P} (\rightarrow (\lambda x \ w. \ \neg x = x))]$ using $A3$ by metis

Proposition 11.7

lemma
$$[(\exists X. \mathcal{P} X) \rightarrow \neg \mathcal{P} ((\lambda x w. \neg x = x))]$$
 using A1a A2 by blast lemma $[\neg \mathcal{P} (\lambda x w. \neg x = x)]$ using A1a A2 by blast

Proposition 11.8 (Informal Proposition 1) - Positive properties are possibly instantiated:

theorem T1:
$$|\forall X. \mathcal{P} X \rightarrow \Diamond \exists^E X | \text{ using } A1a A2 \text{ by } blast$$

Proposition 11.14 - Both defs (God/God^*) are equivalent. For improved performance we may prefer to use one or the other:

lemma $GodDefsAreEquivalent: | \forall x. G x \leftrightarrow G*x |$ **using** A1b **by** force

Proposition 11.15 - Possibilist existence of *God* directly implies *A1b*:

lemma
$$|\exists G^* \to (\forall X. \neg (\mathcal{P} X) \to \mathcal{P} (\to X))|$$
 by meson

```
lemma A3implT2-local: |(\forall Z X. (pos Z \land intersec X Z) \rightarrow \mathcal{P} X) \rightarrow \mathcal{P} G|
proof -
  {
  \mathbf{fix} \ w
  have 1: pos \mathcal{P} w by simp
  have 2: intersec G \mathcal{P} w by simp
    assume (\forall Z X. (pos Z \land intersec X Z) \rightarrow \mathcal{P} X) w
    hence (\forall X. ((pos \mathcal{P}) \land (intersec \ X \ \mathcal{P})) \rightarrow \mathcal{P} \ X) \ w \ \mathbf{by} \ (rule \ all E)

    from 3 4 have P G w by (rule mp)
  hence (\forall Z X. (pos Z \land intersec X Z) \rightarrow \mathcal{P} X) w \longrightarrow \mathcal{P} G w by (rule impI)
  thus ?thesis by (rule allI)
qed
A3 implies P(G) (as global consequence):
lemma A3implT2-global: |\forall Z X. (pos Z \land intersec X Z) \rightarrow \mathcal{P} X| \longrightarrow |\mathcal{P} G|
  using A3implT2-local by (rule localImpGlobalCons)
Being Godlike is a positive property. Note that this theorem can be axiom-
atized directly, as noted by Dana Scott (see [12], p. 152). We will do so for
the second part.
theorem T2: |\mathcal{P}| G| using A3implT2-global A3 by simp
Theorem 11.17 (Informal Proposition 3) - Possibly God exists:
theorem T3: |\Diamond \exists^E G| using T1 T2 by simp
```

Proposition 11.16 - A3 implies P(G) (local consequence):

4.2 Part II - God's Existence is Necessary if Possible

We show here that God's necessary existence follows from its possible existence by adding some additional (potentially controversial) assumptions including an essentialist premise and the S5 axioms. Further results like monotheism and the rejection of free will ($modal\ collapse$) are also proved.

4.2.1 General Definitions

```
abbreviation existencePredicate::\uparrow\langle \mathbf{0}\rangle (E!) where
E! x \equiv (\lambda w. (\exists^E y. y \approx x) w)
consts positiveProperty::\uparrow\langle\uparrow\langle\mathbf{0}\rangle\rangle (P)
```

```
abbreviation God::\uparrow\langle \mathbf{0}\rangle (G) where G \equiv (\lambda x. \ \forall \ Y. \ \mathcal{P} \ Y \rightarrow \ Y \ x) abbreviation God\text{-}star::\uparrow\langle \mathbf{0}\rangle (G*) where G* \equiv (\lambda x. \ \forall \ Y. \ \mathcal{P} \ Y \leftrightarrow \ Y \ x) abbreviation Entailment::\uparrow\langle\uparrow\langle\mathbf{0}\rangle,\uparrow\langle\mathbf{0}\rangle\rangle (infix \Rightarrow 60) where X \Rightarrow Y \equiv \Box(\forall^E z. \ X z \rightarrow \ Y z)
```

4.2.2 Results from Part I

Note that the only use Gödel makes of axiom A3 is to show that being Godlike is a positive property (T2). We follow therefore Scott's proposal and take (T2) directly as an axiom:

axiomatization where

lemma True nitpick[satisfy] oops — model found: axioms are consistent

lemma |D| **using** A1a A1b A2 by blast — axioms already imply D axiom

lemma $GodDefsAreEquivalent: | \forall x. G x \leftrightarrow G*x |$ **using** A1b **by** fastforce

```
theorem T1: [\forall X. \mathcal{P} X \to \Diamond \exists^E X]
using A1a \ A2 by blast — positive properties are possibly instantiated
theorem T3: [\Diamond \exists^E G] using T1 \ T2 by simp — God exists possibly
```

4.2.3 Axioms

 \mathcal{P} satisfies the so-called stability conditions (see [12], p. 124), which means it designates rigidly (note that this makes for an *essentialist* assumption).

axiomatization where

abbreviation
$$rigidPred::('t\Rightarrow io)\Rightarrow io$$
 where $rigidPred \ \tau \equiv (\lambda\beta. \ \Box((\lambda z. \ \beta \approx z) \ \downarrow \tau)) \ \downarrow \tau$

```
lemma \lfloor rigidPred \mathcal{P} \rfloor using A4a \ A4b by blast - \mathcal{P} is therefore rigid
```

lemma *True* **nitpick**[*satisfy*] **oops** — model found: so far all axioms A1-4 consistent

4.2.4 Theorems

```

 thus ?thesis by (rule allI)
Modal collapse is countersatisfiable (unless we introduce S5 axioms):
lemma |\forall \Phi.(\Phi \to (\Box \Phi))| nitpick oops
```

We postulate semantic frame conditions for some modal logics. Taken together, reflexivity, transitivity and symmetry make for an equivalence relation and therefore an S5 logic (via Sahlqvist correspondence). We prefer to postulate them individually here in order to get more detailed information about their relevance in the proofs presented below.

axiomatization where

refl: reflexive aRel and tran: transitive aRel and symm: symmetric aRel

lemma True **nitpick**[satisfy] **oops** — model found: axioms still consistent

Using an S5 logic, modal collapse ($[\forall \Phi.(\Phi \to (\Box \Phi))]$) is actually valid (see 'More Objections' some pages below)

We prove some useful inference rules:

```
lemma modal\text{-}distr: \lfloor \Box(\varphi \to \psi) \rfloor \Longrightarrow \lfloor (\Diamond \varphi \to \Diamond \psi) \rfloor \text{ by } blast lemma modal\text{-}trans: (\lfloor \varphi \to \psi \rfloor \land \lfloor \psi \to \chi \rfloor) \Longrightarrow \lfloor \varphi \to \chi \rfloor \text{ by } simp
```

Theorem 11.27 - Informal Proposition 8. Note that only symmetry and transitivity for the accessibility relation are used.

```
theorem possExistenceImpliesNecEx: [\lozenge \exists G \to \Box \exists E G] — local consequence proof —
```

```
have [\exists \ G \to \Box \exists^E \ G] using GodExistenceImpliesNecExistence by simp — follows from Axioms 11.11, 11.25 and 11.3B hence [\Box(\exists \ G \to \Box \exists^E \ G)] using NEC by simp hence 1: [\lozenge \exists \ G \to \lozenge \Box \exists^E \ G] by (rule\ modal\text{-}distr) have 2: [\lozenge \Box \exists^E \ G \to \Box \exists^E \ G] using symm\ tran by metis — frame conditions from 1\ 2 have [\lozenge \exists \ G \to \lozenge \Box \exists^E \ G] \land [\lozenge \Box \exists^E \ G \to \Box \exists^E \ G] by simp thus ?thesis by (rule\ modal\text{-}trans) qed
```

```
lemma T4: \lfloor \lozenge \exists \ G \rfloor \longrightarrow \lfloor \Box \exists^E \ G \rfloor using possExistenceImpliesNecEx by (rule\ localImpGlobalCons) — global consequence
```

Corollary 11.28 - Necessary (actualist) existence of God (for both definitions); reflexivity is still not used:

```
lemma GodNecExists: [\Box \exists \ ^E \ G] using T3\ T4 by metis lemma God\text{-}starNecExists: [\Box \exists \ ^E \ G*] using GodNecExists\ GodDefsAreEquivalent by simp
```

4.2.5 Monotheism

Monotheism for non-normal models (with Leibniz equality) follows directly from God having all and only positive properties:

```
theorem Monotheism-LeibnizEq: [\forall x. \ G \ x \to (\forall y. \ G \ y \to (x \approx^L y))] using GodDefsAreEquivalent by simp
```

```
Monotheism for normal models is trickier. We need to consider some previous results (p. 162):
```

```
lemma GodExistenceIsValid: |\exists^{E} G| using GodNecExists refl
  by auto — reflexivity is now required by the solver
Proposition 11.29:
theorem Monotheism-normalModel: |\exists x. \forall y. \ G \ y \leftrightarrow x \approx y|
proof -
{
  \mathbf{fix} \ w
 have |\exists^{E} G| using GodExistenceIsValid by simp — follows from corollary 11.28
  hence (\exists^E G) w by (rule \ all E)
  then obtain g where 1: existsAt g w \wedge G g w..
 hence 2: \mathcal{E} G g w using GodIsEssential by blast — follows from ax. 11.11/11.3B
    \mathbf{fix} \ y
    have G \ y \ w \longleftrightarrow (g \approx y) \ w proof
      assume G y w
      hence 3: \mathcal{E} G y w using GodIsEssential by blast
      have (\mathcal{E} \ G \ y \to (G \Rrightarrow id \ y)) \ w \ using \ Essences Characterize Completely
        by simp — follows from theorem 11.23
      hence \mathcal{E} \ G \ y \ w \longrightarrow ((G \Rrightarrow id \ y) \ w) by simp
      from this 3 have (G \Rightarrow id \ y) \ w by (rule \ mp)
      hence (\Box(\forall^E z. \ G \ z \to z \approx y)) \ w \ \text{by } simp
      hence \forall x. \ w \ r \ x \longrightarrow ((\forall z. \ (existsAt \ z \ x \land G \ z \ x) \longrightarrow z = y)) by auto
      hence w r w \longrightarrow ((\forall z. (existsAt z w \land G z w) \longrightarrow z = y)) by (rule allE)
      hence \forall z. (w \ r \ w \land existsAt \ z \ w \land G \ z \ w) \longrightarrow z = y \ \textbf{by} \ auto
      hence 4: (w \ r \ w \land existsAt \ g \ w \land G \ g \ w) \longrightarrow g = y \ \textbf{by} \ (rule \ all E)
      have w r w using refl
        by simp — using frame reflexivity (Axiom M)
      hence w r w \wedge (existsAt \ g \ w \wedge G \ g \ w) using 1 by (rule \ conjI)
      from 4 this have g = y by (rule mp)
      thus (q \approx y) w by simp
    next
      assume (g \approx y) w
      from this 2 have \mathcal{E} G y w by simp
      thus G y w by (rule conjunct1)
    qed
  hence \forall y. \ G \ y \ w \longleftrightarrow (g \approx y) \ w \ \text{by} \ (rule \ all I)
  hence \exists x. (\forall y. G y w \longleftrightarrow (x \approx y) w) by (rule \ exI)
  hence (\exists x. (\forall y. G y \leftrightarrow (x \approx y))) w by simp
thus ?thesis by (rule allI)
qed
```

Corollary 11.30:

```
lemma GodImpliesExistence: [\forall x. G x \rightarrow E! x] using GodExistenceIs Valid Monotheism-normalModel by metis
```

4.2.6 Positive Properties are Necessarily Instantiated

lemma PosPropertiesNecExist: $[\forall Y. \mathcal{P} Y \rightarrow \Box \exists^E Y]$ using GodNecExists A4a by meson — proposition 11.31: follows from corollary 11.28 and axiom A4a

4.2.7 More Objections

Fitting discusses the objection raised by Sobel [19], who argues that Gödel's axiom system is too strong: it implies that whatever is the case is so necessarily, i.e. the modal system collapses ($\varphi \longrightarrow \Box \varphi$). The modal collapse has been philosophically interpreted as implying the absence of free will.

We start by proving an useful FOL lemma:

```
lemma useful: (\forall x. \varphi x \longrightarrow \psi) \Longrightarrow ((\exists x. \varphi x) \longrightarrow \psi) by simp
```

In the context of our S5 axioms, the *modal collapse* becomes valid (pp. 163-4):

```
lemma ModalCollapse: |\forall \Phi.(\Phi \rightarrow (\Box \Phi))|
proof -
  \mathbf{fix}\ w
   {
     have (\forall x. \ G \ x \to (\mathcal{E} \ G \ x)) \ w \ using \ GodIsEssential
       by (rule allE) — follows from Axioms 11.11 and 11.3B
     hence \forall x. \ G \ x \ w \longrightarrow \mathcal{E} \ G \ x \ w \ \text{by } simp
     hence \forall x. \ G \ x \ w \longrightarrow (\forall Z. \ Z \ x \rightarrow \Box(\forall^E z. \ G \ z \rightarrow Z \ z)) \ w \ by force
     hence \forall x. \ G \ x \ w \longrightarrow ((\lambda y. \ Q) \ x \rightarrow \Box (\forall Ez. \ G \ z \rightarrow (\lambda y. \ Q) \ z)) \ w \ \text{by force}
    hence \forall x. \ G \ x \ w \longrightarrow (Q \rightarrow \Box (\forall^E z. \ G \ z \rightarrow Q)) \ w \ \text{by } simp
     hence 1: (\exists x. \ G \ x \ w) \longrightarrow ((Q \rightarrow \Box(\forall Ez. \ G \ z \rightarrow Q)) \ w) by (rule useful)
     have \exists x. \ G \ x \ w \ using \ GodExistenceIsValid by \ auto
    from 1 this have (Q \to \Box (\forall^E z. \ G \ z \to Q)) \ w by (rule \ mp)
     hence (Q \to \Box((\exists^E z. \ G \ z) \to Q)) w using useful by blast
     hence (Q \to (\Box(\exists^E z. \ G \ z) \to \Box Q)) \ w \ \text{by } simp
     hence (Q \to \Box Q) w using GodNecExists by simp
  hence (\forall \Phi. \Phi \rightarrow \Box \Phi) w \text{ by } (rule \ all I)
  thus ?thesis by (rule allI)
qed
```

5 Fitting's Solution

In this section we consider Fitting's solution to the objections raised in his discussion of Gödel's Argument pp. 164-9, especially the problem of *modal collapse*, which has been metaphysically interpreted as implying a rejection of free will. Since we are generally committed to the existence of free will (in a pre-theoretical sense), such a result is philosophically unappealing and rather seen as a problem in the argument's formalisation.

This part of the book still leaves several details unspecified and the reader is thus compelled to fill in the gaps. As a result, we came across some premises and theorems allowing for different formalisations and therefore leading to disparate implications. Only some of those cases are shown here for illustrative purposes. The options we have chosen here are such that they indeed validate the argument (and we assume that they correspond to Fitting's intention.

5.1 General Definitions

The following is an existence predicate for our object-language. (We have previously shown it is equivalent to its meta-logical counterpart.)

```
abbreviation existencePredicate::\uparrow \langle \mathbf{0} \rangle (E!) where E! x \equiv (\lambda w. (\exists^E y. y \approx x) w)
```

Reminder: The '(|-|)' parenthesis are used to convert an extensional object into its 'rigid' intensional counterpart (e.g. $(\varphi) \equiv \lambda w$. φ). They were introduced only for type correctness.

```
consts positiveProperty::\uparrow\langle\langle \mathbf{0}\rangle\rangle\ (\mathcal{P})

abbreviation God::\uparrow\langle \mathbf{0}\rangle\ (G) where G\equiv(\lambda x.\ \forall\ Y.\ \mathcal{P}\ Y\rightarrow(Yx))

abbreviation God\text{-}star::\uparrow\langle \mathbf{0}\rangle\ (G*) where G*\equiv(\lambda x.\ \forall\ Y.\ \mathcal{P}\ Y\leftrightarrow(Yx))

abbreviation Entailment::\uparrow\langle\langle \mathbf{0}\rangle,\langle \mathbf{0}\rangle\rangle\ (infix\ \Rrightarrow\ 6\theta) where X\Rrightarrow Y\equiv \Box(\forall\ ^Ez.\ (Xz)\rightarrow(Yz))
```

5.2 Part I - God's Existence is Possible

axiomatization where

```
\begin{array}{lll} \textit{A1a:} [\forall \, X. \, \mathcal{P} \, (\neg X) \to \neg (\mathcal{P} \, X) \, ] \, \, \textbf{and} & -\text{ axiom } 11.3 \text{A} \\ \textit{A1b:} [\forall \, X. \, \neg (\mathcal{P} \, X) \to \mathcal{P} \, (\neg X)] \, \, \textbf{and} & -\text{ axiom } 11.3 \text{B} \\ \textit{A2:} [\forall \, X \, Y. \, (\mathcal{P} \, X \wedge (X \Rrightarrow Y)) \to \mathcal{P} \, Y] \, \, \textbf{and} & -\text{ axiom } 11.5 \\ \textit{T2:} [\mathcal{P} \downarrow G] & -\text{ proposition } 11.16 \, (\text{modified}) \end{array}
```

lemma True **nitpick**[satisfy] **oops** — model found: axioms are consistent

lemma $GodDefsAreEquivalent: | \forall x. G x \leftrightarrow G*x |$ using A1b by fastforce

T1 (Positive properties are possibly instantiated) can be formalised in two different ways:

```
theorem T1a: [\forall X :: \langle \mathbf{0} \rangle. \mathcal{P} \ X \to \Diamond (\exists^E z. (|X z|))] using A1a \ A2 by blast — this is the one used in the book theorem T1b: [\forall X :: \uparrow \langle \mathbf{0} \rangle. \mathcal{P} \downarrow X \to \Diamond (\exists^E z. X z)] nitpick oops — this one is also possible but not valid so we won't use it
```

Some interesting (non-)equivalences:

```
\begin{array}{l} \mathbf{lemma} \ [\Box \exists^E \ (Q :: \uparrow \langle \mathbf{0} \rangle) \ \leftrightarrow \ \Box (\exists^E \ \downarrow Q) ] \ \mathbf{by} \ simp \\ \mathbf{lemma} \ [\Box \exists^E \ (Q :: \uparrow \langle \mathbf{0} \rangle) \ \leftrightarrow \ ((\lambda X. \ \Box \exists^E \ X) \ Q) ] \ \mathbf{by} \ simp \\ \mathbf{lemma} \ [\Box \exists^E \ (Q :: \uparrow \langle \mathbf{0} \rangle) \ \leftrightarrow \ ((\lambda X. \ \Box \exists^E \ \downarrow X) \ Q) ] \ \mathbf{by} \ simp \\ \mathbf{lemma} \ [\Box \exists^E \ (Q :: \uparrow \langle \mathbf{0} \rangle) \ \leftrightarrow \ ((\lambda X. \ \Box \exists^E \ X) \ \downarrow Q) | \ \mathbf{nitpick \ oops} \ -- \ \mathbf{not} \ \mathbf{equivalent}! \end{array}
```

T3 (God exists possibly) can be formalised in two different ways, using a de re or a de dicto reading.

```
theorem T3-deRe: \lfloor (\lambda X. \lozenge \exists^E X) \downarrow G \rfloor using T1a \ T2 by simp theorem T3-deDicto: |\lozenge \exists^E \downarrow G| nitpick oops — countersatisfiable
```

From the last two theorems, we think T3-deRe should be the version originally implied in the book, since T3-deDicto is not valid (T1b were valid but it isn't)

```
lemma assumes T1b: [\forall X. \mathcal{P} \downarrow X \rightarrow \Diamond(\exists^E z. X z)] shows T3-deDicto: [\Diamond \exists^E \downarrow G] using assms T2 by simp
```

5.3 Part II - God's Existence is Necessary if Possible

In this variant \mathcal{P} also designates rigidly, as shown in the last section.

axiomatization where

```
A4a: [\forall X. \mathcal{P} X \to \Box(\mathcal{P} X)] — axiom 11.11 lemma A4b: |\forall X. \neg(\mathcal{P} X) \to \Box\neg(\mathcal{P} X)| using A1a \ A1b \ A4a by blast
```

lemma True nitpick[satisfy] oops — model found: so far all axioms consistent

abbreviation essence
$$Of :: \uparrow \langle \langle \mathbf{0} \rangle, \mathbf{0} \rangle$$
 (\mathcal{E}) where $\mathcal{E} \ Y \ x \equiv (Y \ x) \land (\forall \ Z :: \langle \mathbf{0} \rangle, (Z \ x) \rightarrow Y \Rrightarrow Z)$

Theorem 11.20 - Informal Proposition 5

theorem GodIsEssential: $|\forall x. \ G \ x \to ((\mathcal{E} \downarrow_1 G) \ x)|$ using A1b by metis

Theorem 11.21

theorem God-starIsEssential: $[\forall x. \ G*x \rightarrow ((\mathcal{E} \downarrow_1 G*)x)]$ by meson

abbreviation
$$necExistencePred:: \uparrow \langle \mathbf{0} \rangle \ (NE)$$
 where $NE \ x \equiv \lambda w. \ (\forall \ Y. \ \mathcal{E} \ Y \ x \rightarrow \Box (\exists \ ^Ez. \ (| \ Yz|))) \ w$

```
Informal Axiom 5
```

axiomatization where

```
A5: \lfloor \mathcal{P} \downarrow NE \rfloor
```

lemma True nitpick[satisfy] oops — model found: so far all axioms consistent

Reminder: We use the down-arrow notation because it is more explicit. See (non-)equivalences above.

```
\begin{array}{l} \mathbf{lemma} \ [\exists \ G \leftrightarrow \exists \ \downarrow G] \ \mathbf{by} \ simp \\ \mathbf{lemma} \ [\exists^E \ G \leftrightarrow \exists^E \ \downarrow G] \ \mathbf{by} \ simp \\ \mathbf{lemma} \ [\Box \exists^E \ G \leftrightarrow \ \Box \exists^E \ \downarrow G] \ \mathbf{by} \ simp \end{array}
```

Theorem 11.26 (Informal Proposition 7) - (possibilist) existence of God implies necessary (actualist) existence.

There are two different ways of formalising this theorem. Both of them are proven valid:

First version:

```
theorem GodExImpliesNecEx-v1: |\exists \downarrow G \rightarrow \Box \exists^E \downarrow G|
proof -
  \mathbf{fix} \ w
   {
     assume \exists x. \ G \ x \ w
     then obtain g where 1: G g w ...
    hence NE g w using A5 by auto
     hence \forall Y. (\mathcal{E} \ Y \ g \ w) \longrightarrow (\Box(\exists^E z. (|Y z|))) \ w \ \mathbf{by} \ simp
    hence (\mathcal{E}(\lambda x. \ G \ x \ w) \ g \ w) \longrightarrow (\Box(\exists^E z. \ ((\lambda x. \ G \ x \ w) \ z))) \ w \ \mathbf{by} \ (\mathit{rule all} E)
    hence 2: ((\mathcal{E}\downarrow_1 G) \ g \ w) \longrightarrow (\Box(\exists^E G)) \ w \ using \ A4b \ by \ meson
     have (\forall x. \ G \ x \to ((\mathcal{E} \downarrow_1 G) \ x)) \ w \ using \ GodIsEssential \ by \ (rule \ all E)
     hence (G g \to ((\mathcal{E} \downarrow_1 G) g)) w by (rule \ all E)
    hence G g w \longrightarrow (\mathcal{E} \downarrow_1 G) g w by simp
     from this 1 have 3: (\mathcal{E} \downarrow_1 G) g w by (rule mp)
     from 2 3 have (\Box \exists E \ G) \ w \ \text{by} \ (rule \ mp)
  hence (\exists x. \ G \ x \ w) \longrightarrow (\Box \exists^E \ G) \ w \ \mathbf{by} \ (rule \ impI)
  hence ((\exists x. \ G \ x) \rightarrow \Box \exists^E \ G) \ w \ \text{by } simp
 thus ?thesis by (rule allI)
```

Second version (which can be proven directly by automated tools using the previous version):

```
theorem GodExImpliesNecEx-v2: [\exists \downarrow G \rightarrow ((\lambda X. \Box \exists E X) \downarrow G)] using A4a \ GodExImpliesNecEx-v1 by metis
```

In contrast to Gödel's argument (as presented by Fitting), the following theorems can be proven in logic K (the S5 axioms are no longer needed):

```
Theorem 11.27 - Informal Proposition 8
```

```
theorem possExImpliesNecEx-v1: \lfloor \Diamond \exists \downarrow G \rightarrow \Box \exists^E \downarrow G \rfloor
using GodExImpliesNecEx-v1: T3-deRe by metis
theorem possExImpliesNecEx-v2: \lfloor (\lambda X. \Diamond \exists^E X) \downarrow G \rightarrow ((\lambda X. \Box \exists^E X) \downarrow G) \rfloor
using GodExImpliesNecEx-v2 by blast
```

Corollaries:

```
lemma T4\text{-}v1: \lfloor \lozenge \exists \downarrow G \rfloor \longrightarrow \lfloor \Box \exists^E \downarrow G \rfloor

using possExImpliesNecEx\text{-}v1 by simp

lemma T4\text{-}v2: \lfloor (\lambda X. \lozenge \exists^E X) \downarrow G \rfloor \longrightarrow \lfloor (\lambda X. \Box \exists^E X) \downarrow G \rfloor

using possExImpliesNecEx\text{-}v2 by simp
```

5.4 Conclusion (De Re and De Dicto Reading)

```
Version I - Necessary Existence of God (de dicto):
```

```
lemma GodNecExists-v1: [\Box \exists^E \downarrow G] using GodExImpliesNecEx-v1 T3-deRe by fastforce — corollary 11.28 lemma God-starNecExists-v1: [\Box \exists^E \downarrow G*] using GodNecExists-v1 GodDefsAreEquivalent by simp lemma [\Box(\lambda X. \exists^E X) \downarrow G*] using God-starNecExists-v1 by simp — de dicto shown here explicitly
```

Version II - Necessary Existence of God (de re)

```
lemma GodNecExists-v2: \lfloor (\lambda X. \Box \exists^E X) \downarrow G \rfloor using T3-deRe\ T4-v2 by blast lemma God-starNecExists-v2: \lfloor (\lambda X. \Box \exists^E X) \downarrow G* \rfloor using GodNecExists-v2 GodDefsAreEquivalent by simp
```

5.5 Modal Collapse

Modal collapse is countersatisfiable even in S5. Note that countermodels with a cardinality of one for the domain of individuals are found by Nitpick (the countermodel shown in the book has cardinality of two).

```
lemma [\forall \Phi.(\Phi \to (\Box \Phi))]
nitpick[card \ 't=1, \ card \ i=2] oops — countermodel found in K
axiomatization where
```

```
S5: equivalence aRel — assume S5 logic
```

```
lemma [\forall \Phi.(\Phi \to (\Box \Phi))]
nitpick[card \ 't=1, \ card \ i=2] oops — countermodel also found in S5
```

6 Anderson's Alternative

In this final section, we verify Anderson's emendation of Gödel's argument, as it is presented in the last part of the textbook by Fitting (pp. 169-171).

6.1 General Definitions

```
abbreviation existencePredicate::\uparrow\langle \mathbf{0}\rangle (E!) where E! x \equiv \lambda w. (\exists^E y. \ y \approx x) w consts positiveProperty::\uparrow\langle \uparrow\langle \mathbf{0}\rangle\rangle (\mathcal{P}) abbreviation God::\uparrow\langle \mathbf{0}\rangle (G^A) where G^A \equiv \lambda x. \ \forall \ Y. \ (\mathcal{P}\ Y) \leftrightarrow \Box(Yx) abbreviation Entailment::\uparrow\langle \uparrow\langle \mathbf{0}\rangle, \uparrow\langle \mathbf{0}\rangle\rangle (infix \Rightarrow 60) where X \Rightarrow Y \equiv \Box(\forall^E z. \ Xz \rightarrow Yz)
```

6.2 Part I - God's Existence is Possible

axiomatization where

$$\begin{array}{lll} \textit{A1a:} \lfloor \forall \, \textit{X}. \, \, \mathcal{P} \, \, (\rightarrow \textit{X}) \rightarrow \neg (\mathcal{P} \, \, \textit{X}) \, \, \rfloor \, \, \textbf{and} & - \, \, \text{Axiom 11.3A} \\ \textit{A2:} \, \left\lfloor \forall \, \textit{X} \, \, \textit{Y}. \, \, (\mathcal{P} \, \, \textit{X} \wedge \, (\textit{X} \, \Rrightarrow \, \textit{Y})) \rightarrow \mathcal{P} \, \, \textit{Y} \, \right\rfloor \, \, \textbf{and} & - \, \, \, \text{Axiom 11.5} \\ \textit{T2:} \, \left\lfloor \mathcal{P} \, \, \textit{G}^{\textit{A}} \, \right\rfloor & - \, \, \text{Proposition 11.16} \end{array}$$

lemma True nitpick[satisfy] oops — model found: axioms are consistent

```
theorem T1: [\forall X. \mathcal{P} X \to \Diamond \exists^E X]
using A1a \ A2 by blast — positive properties are possibly instantiated
theorem T3: [\Diamond \exists^E G^A] using T1 \ T2 by simp — God exists possibly
```

6.3 Part II - God's Existence is Necessary if Possible

 \mathcal{P} now satisfies only one of the stability conditions. But since the argument uses an S5 logic, the other stability condition is implied. Therefore \mathcal{P} becomes rigid (see p. 124).

axiomatization where

```
A4a: |\forall X. \mathcal{P} X \to \Box(\mathcal{P} X)| — axiom 11.11
```

We again postulate our S5 axioms:

axiomatization where

refl: reflexive aRel and tran: transitive aRel and symm: symmetric aRel

lemma True **nitpick**[satisfy] **oops** — model found: so far all axioms consistent

abbreviation
$$rigidPred::('t\Rightarrow io)\Rightarrow io$$
 where $rigidPred \ \tau \equiv (\lambda\beta. \ \Box((\lambda z. \ \beta \approx z) \ \downarrow \tau)) \ \downarrow \tau$

```
lemma A4b: [\forall X. \neg (\mathcal{P} X) \rightarrow \Box \neg (\mathcal{P} X)]

using A4a symm by auto — note only symmetry is needed (B axiom)

lemma [rigidPred \mathcal{P}]

using A4a A4b by blast — \mathcal{P} is therefore rigid in a B logic

Essence, Anderson Version (Definition 11.34)

abbreviation essenceOf::\uparrow \langle \uparrow \langle \mathbf{0} \rangle, \mathbf{0} \rangle (\mathcal{E}^A) where

\mathcal{E}^A Y x \equiv (\forall Z. \Box (Z x) \leftrightarrow Y \Rightarrow Z)

Necessary Existence, Anderson Version (Definition 11.35)

abbreviation necessaryExistencePred::\uparrow \langle \mathbf{0} \rangle (NE^A)

where NE^A x \equiv (\lambda w. (\forall Y. \mathcal{E}^A Y x \rightarrow \Box \exists E Y) w)
```

Theorem 11.36 - If g is God-like, then the property of being God-like is the essence of g.

As shown before, this theorem's proof could be completely automatized for Gödel's and Fitting's variants. For Anderson's version however, we had to provide Isabelle with some help based on the corresponding natural-language proof given by Anderson (see [2] Theorem 2*, p. 296)

```
theorem GodIsEssential: |\forall x. G^A x \rightarrow (\mathcal{E}^A G^A x)|
proof -
{
  \mathbf{fix} \ w
  {
    \mathbf{fix} \ g
       assume G^A g w
       hence 1: \forall Y. (\mathcal{P} Y w) \longleftrightarrow (\Box (Y g)) w by simp
          \mathbf{fix} \ Q
          from 1 have 2: (P Q w) \longleftrightarrow (\Box (Q g)) w by (rule \ all E)
          have (\Box(Q\ g))\ w\longleftrightarrow (G^A \Rrightarrow Q)\ w—we need to prove \to and \leftarrow
               assume (\Box(Q\ g))\ w — suppose g is God-like and necessarily has Q
               hence \mathcal{Z}: (\mathcal{P} \ Q \ w) using \mathcal{Z} by simp — then Q is positive
               {
                 \mathbf{fix}\ u
                 have (\mathcal{P}\ Q\ u) \longrightarrow (\forall x.\ G^A\ x\ u \longrightarrow (\Box(Q\ x))\ u)
                    by auto — using the definition of God-like
                 have (\mathcal{P}\ Q\ u) \longrightarrow (\forall x.\ G^A\ x\ u \longrightarrow ((Q\ x))\ u)
                    using refl by auto — and using \Box(\varphi x) \longrightarrow \varphi x
               hence \forall z. (\mathcal{P} \ Q \ z) \longrightarrow (\forall x. \ G^A \ x \ z \longrightarrow Q \ x \ z) by (rule allI)
               hence |\mathcal{P}| \stackrel{\frown}{Q} \rightarrow (\forall x. \ G^{\stackrel{\frown}{A}} \ x \rightarrow Q \ x)|
                 by auto — if Q is positive, then whatever is God-like has Q
```

```
hence |(\Box(\mathcal{P}\ Q)) \to \Box(\forall x.\ G^A\ x \to Q\ x)| using K by auto
             hence |(\Box(\mathcal{P} Q)) \to G^A \Rightarrow Q| by simp
             hence ((\Box(\mathcal{P}\ Q)) \to G^A \Rightarrow Q) \ w \ \text{by} \ (rule \ all E)
             hence 4: (\Box(\mathcal{P} Q)) \ w \longrightarrow (G^A \Rightarrow Q) \ w \text{ by } simp
             have |\forall X. \mathcal{P} X \to \Box(\mathcal{P} X)| by (rule A4a) — using axiom 4
             hence (\forall X. \mathcal{P} X \to (\Box(\mathcal{P} X))) w by (rule \ all E)
             hence \mathcal{P}\ Q\ w \longrightarrow (\Box(\mathcal{P}\ Q))\ w by (rule all E)
             hence \mathcal{P} \ Q \ w \longrightarrow (G^A \Rrightarrow Q) \ w \text{ using 4 by } simp
              thus (G^A \Rightarrow Q) w using 3 by (rule \ mp) \longrightarrow direction
             assume 5: (G^A \Rightarrow Q) w — suppose Q is entailed by being God-like
            have [\forall X \ Y. \ (\mathcal{P} \ X \land (X \Rrightarrow Y)) \rightarrow \mathcal{P} \ Y | \ \mathbf{by} \ (\mathit{rule} \ A2)
            hence (\forall X \ Y. \ (\mathcal{P} \ X \land (X \Rrightarrow Y)) \rightarrow \mathcal{P} \ \overline{Y}) \ w \ \text{by} \ (rule \ all E)
            hence \forall X \ Y. \ (\mathcal{P} \ X \ w \land (X \Rightarrow Y) \ w) \longrightarrow \mathcal{P} \ Y \ w \ \text{by } simp
            hence \forall Y. (\mathcal{P} G^A w \wedge (G^A \Rightarrow Y) w) \longrightarrow \mathcal{P} Y w  by (rule \ all E)
             hence \theta: (\mathcal{P} \ G^A \ w \land (G^A \Rightarrow Q) \ w) \longrightarrow \mathcal{P} \ Q \ w \ \text{by} \ (rule \ all E)
             have |\mathcal{P}|\hat{G}^A| by (rule\ T2)
             hence \mathcal{P} G^A w by (rule all E)
             hence \mathcal{P} G^A w \wedge (G^A \Rightarrow Q) w using 5 by (rule conjI)
             from 6 this have P Q w by (rule mp) — Q is positive by A2 and T2
             thus (\Box(Q g)) w using 2 by simp
          qed
     hence \forall Z. (\Box(Z g)) \ w \longleftrightarrow (G^A \Rightarrow Z) \ w \ \text{by} \ (rule \ all I)
     hence (\forall Z. \Box (Z g) \leftrightarrow G^A \Rightarrow Z) w by simp
     hence \mathcal{E}^A G^A g w by simp
    hence G^A g w \longrightarrow \mathcal{E}^A G^A g w by (rule impI)
  hence \forall x. \ G^A \ x \ w \longrightarrow \mathcal{E}^A \ G^A \ x \ w by (rule allI)
 thus ?thesis by (rule allI)
qed
Axiom 11.37 (Anderson's version of 11.25)

7 Conclusion

We presented a shallow semantical embedding in Isabelle/HOL for an intensional higher-order modal logic (a successor of Montague/Gallin intensional logics) as introduced by M. Fitting in his textbook Types, Tableaus and Gödel's God [12]. We subsequently employed this logic to formalise and verify all results (theorems, examples and exercises) relevant to the discussion of Gödel's ontological argument in the last part of Fitting's book. Three different versions of the ontological argument have been considered: the first one by Gödel himself (respectively, Scott), the second one by Fitting and the last one by Anderson.

By employing an interactive theorem-prover like Isabelle, we were not only able to verify Fitting's results, but also to guarantee consistency. We could prove even stronger versions of many of the theorems and find better countermodels (i.e. with smaller cardinality) than the ones presented in the book. Another interesting aspect was the possibility to explore the implications of alternative formalisations for definitions and theorems which shed light on interesting philosophical issues concerning entailment, essentialism and free will, which are currently the subject of some follow-up analysis.

The latest developments in automated theorem proving allow us to engage in much more experimentation during the formalisation and assessment of arguments than ever before. The potential reduction (of several orders of magnitude) in the time needed for proving or disproving theorems (compared to pen-and-paper proofs), results in almost real-time feedback about the suitability of our speculations. The practical benefits of computer-supported argumentation go beyond mere quantitative (easier, faster and more reliable proofs). The advantages are also qualitative, since it fosters a different approach to argumentation: We can now work iteratively (by 'trial-and-error') on an argument by making gradual adjustments to its definitions, axioms and theorems. This allows us to continuously expose and revise the assumptions we indirectly commit ourselves everytime we opt for some particular formalisation.
